Chairman
Don Burt**

At four in the morning on March 28, 1979, a malfunction in the cooling system at the Three Mile Island Nuclear Generating Station led to the most serious commercial nuclear accident in US history and paved the way for reforms in the way nuclear power plants are operated and regulated. It also made Americans question the safety of nuclear power and helped make The China Syndrome - which had been released three weeks earlier - one of the biggest movies of the year.
